

Lab 3: Video Joining with Premier Pro

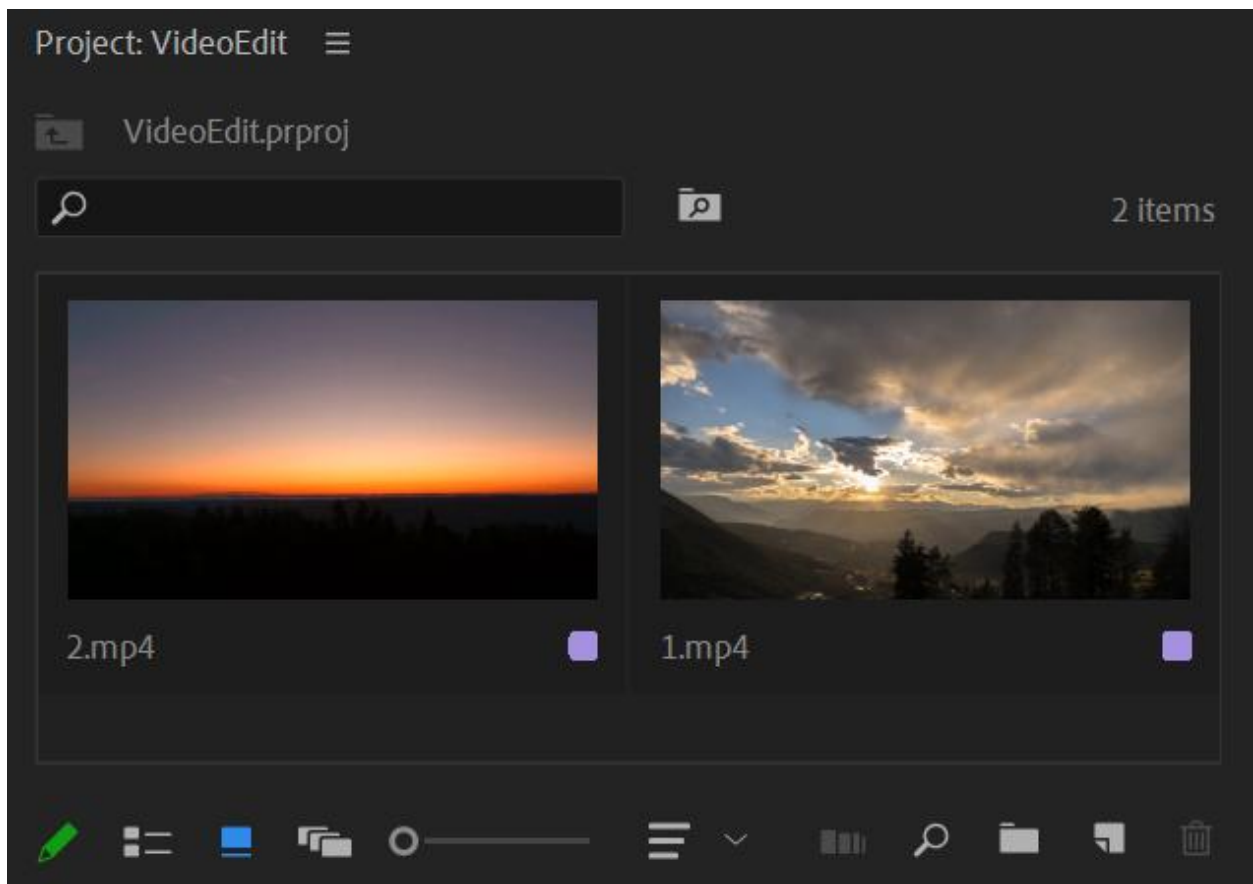

Creating new project

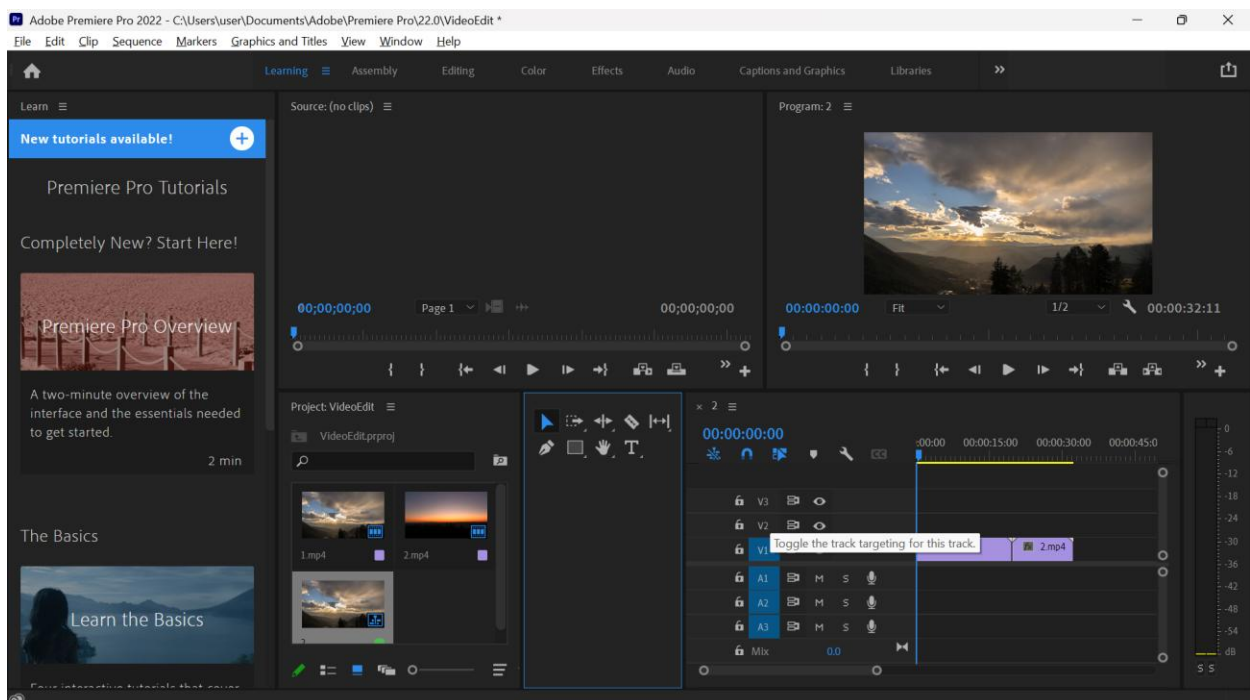

Double click in the region where import media is written

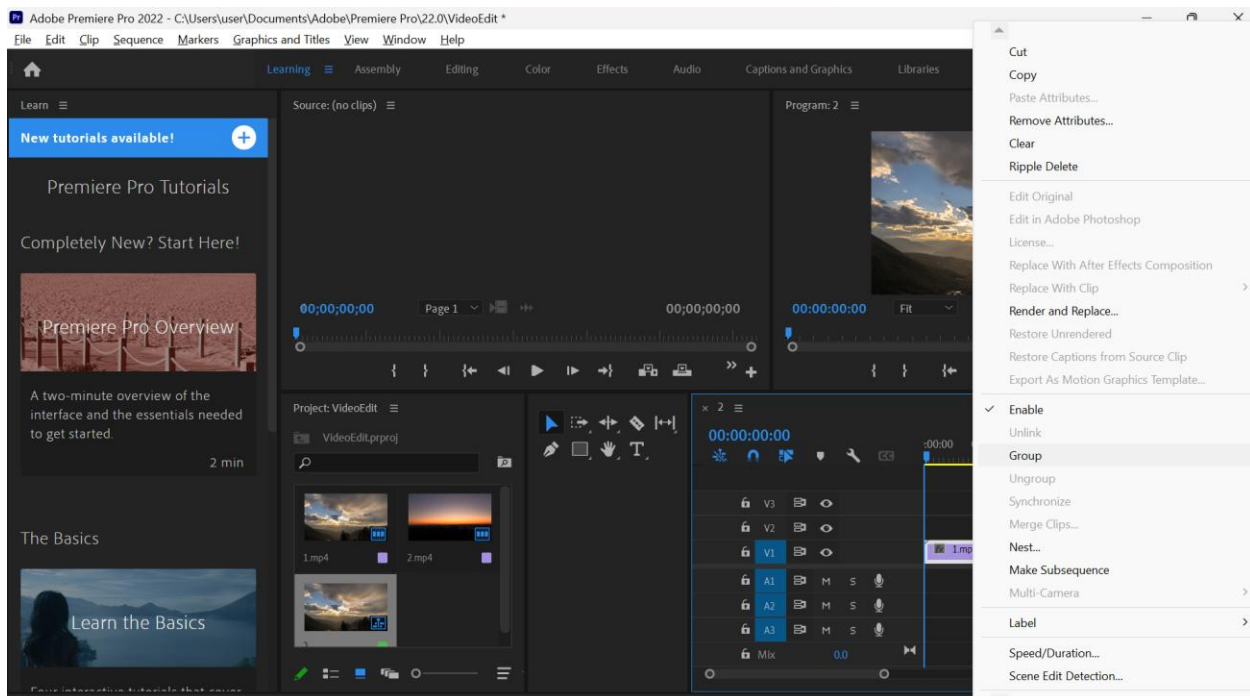

The imported media will look like this:

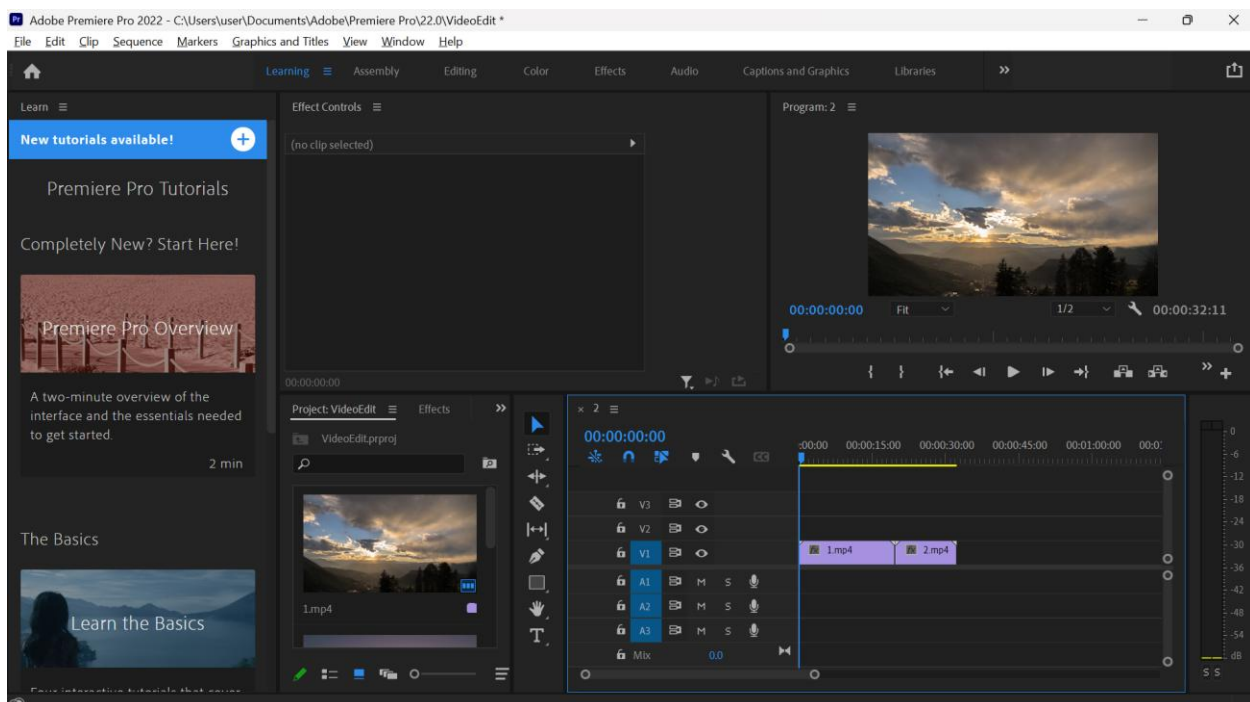

Drag the video clip into the right side for grouping them

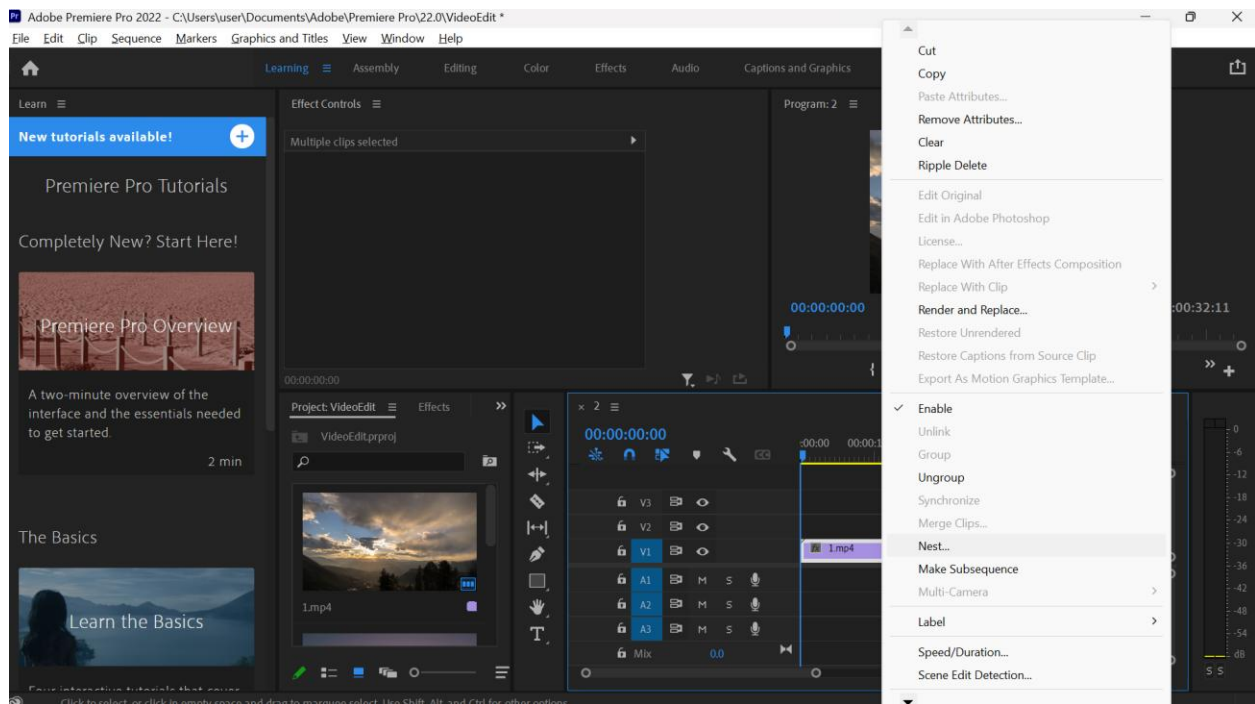

Select the both clip and right click to group them

After grouping it will be a single video:

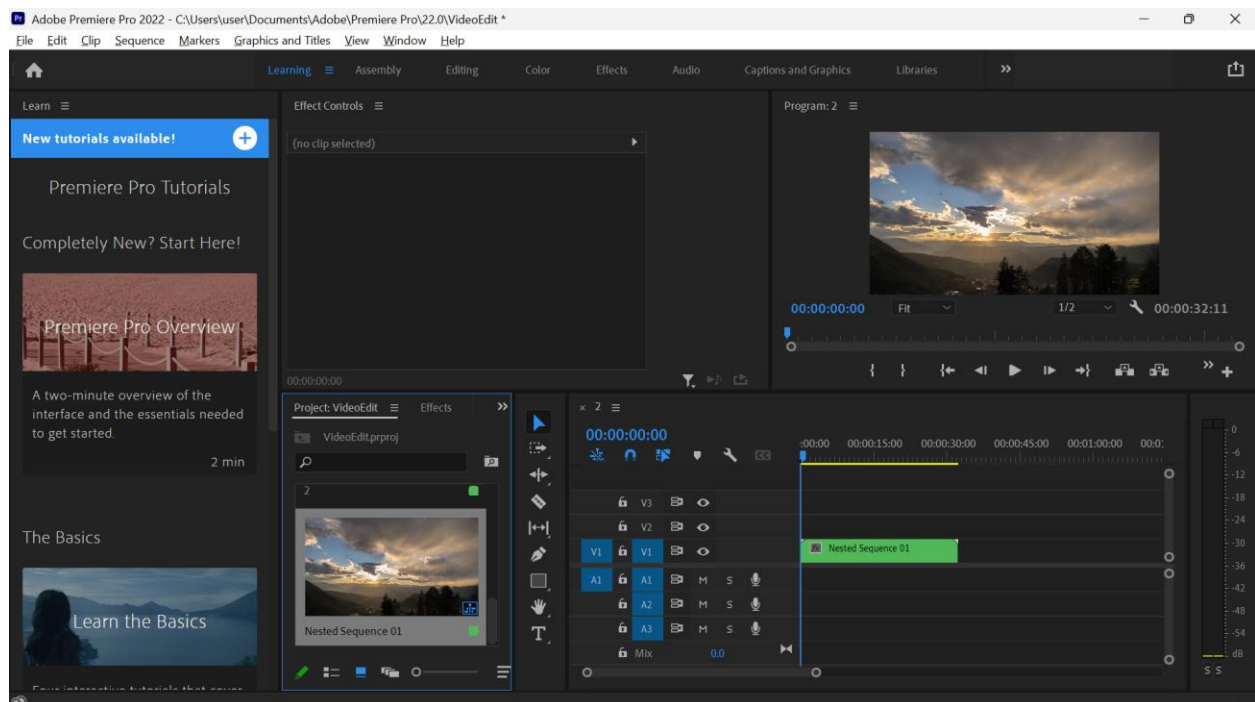

After grouping the video, click the right button and then click nest:

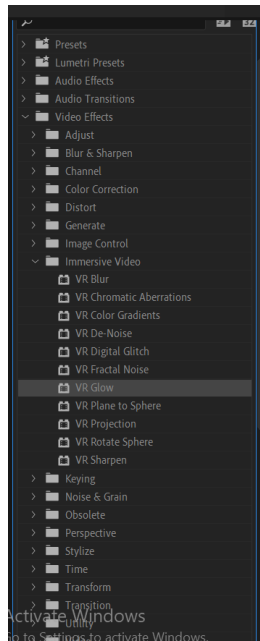

We use the nest because it allows us to create a sequence within another sequence, treating the nested sequence as a single clip, which then can be manipulated and edited as one.

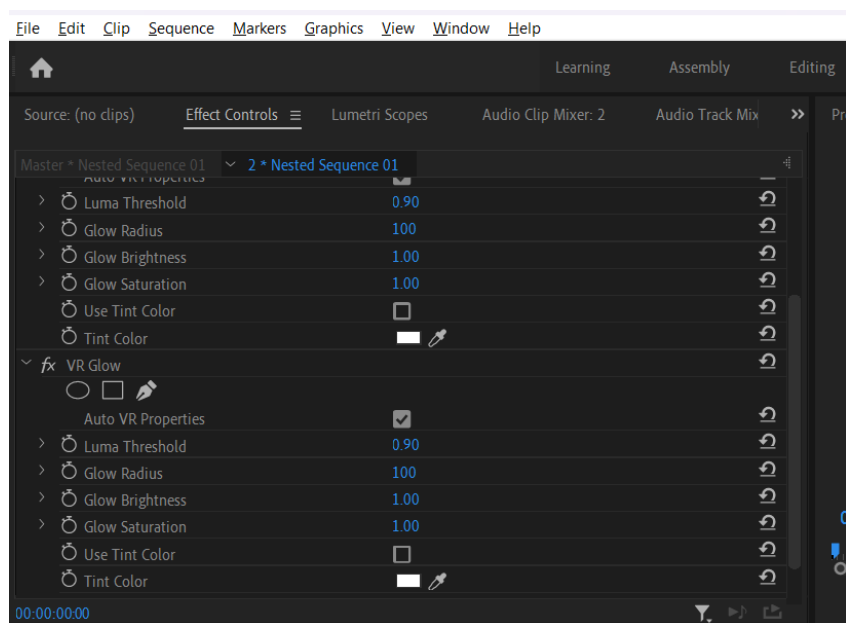

After nest it will be look like this:

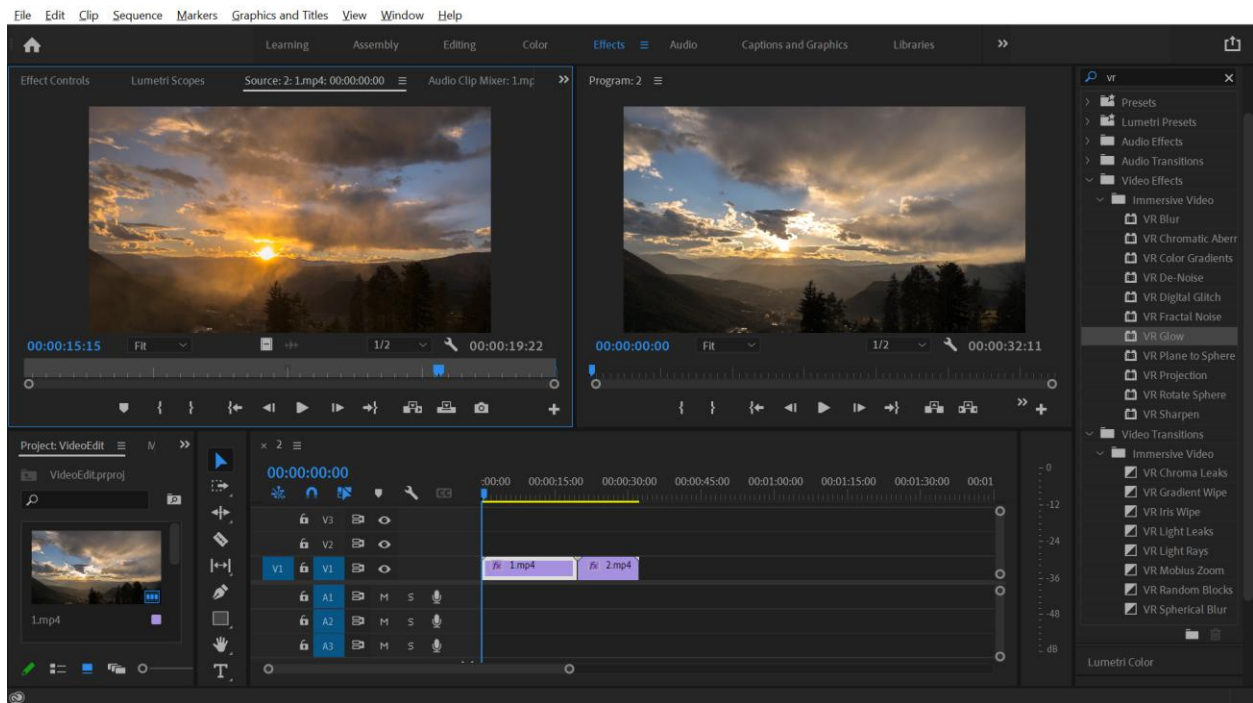

We can add effect to our nested video:

By dragging VR Glow to the video we can add the effect. We can adjust the effect through effect controls:

Finally, after adding effect our video is look like:

By following all these steps we can mix the video.

CONCLUSION:

In this lab, we mix the video clips. We learned how to import the media file and group them together. We use nest to our grouped vide because it allows us to create a sequence within another where the sequences are treated as single clip so that we can edit is as a one. We add effects on the nested clip. And finally, our mixed video is created.
